# Business Models and the Business Model Canvas

| | |
|---|---|
| **1. Onboarding** | Where we are and where we are going |
| **2. Landing Page Brief** | Communicating the product promise |
| **3. Prototype Brief** | Demonstrating the critical user experience |
| **4. Planning** | Defining what to build |
| **5. Vibing** | AI-assisted creation and experimentation |

# Learning Outcomes

By the end of today, you should be able to:

- Explain how **landing pages** and **functional prototypes** communicate a product's value proposition and demonstrate its intended user experience.
- Define the **critical user journey, essential interactions, and minimum functionality** needed to create a focused, testable prototype.
- Apply **AI-assisted prototyping** to turn a product concept into a high-fidelity landing page and interactive prototype, ready for further development and usability testing.

# Our Product Development Journey

## Discover the opportunity

Understand the problem, users, stakeholders, and current situation.

***Artefact 1***

## Define the product

Decide what to build, for whom, and how the business model works.

***Artefact 2***

## Build and test the concept

Create and test a landing page and functional prototype.

**Artefact 3**

## Propose the product

Prepare, present and defend the final product proposal.

**Artefact 4**

# Two Artefacts, Two Different Jobs

## Landing Page

Communicates the promise

- Targets potential customers, buyers, or decision-makers.
- Explains the value proposition and benefits.
- Shows why the solution is worth considering or adopting.

***Why should I invest?***

## Functional Prototype

Demonstrates the experience

- Focuses on the people who will actually use the product.
- Shows how the product supports critical user journeys.
- Allows users to perform meaningful tasks.

***Can I accomplish what I need?***

*The landing page communicates why the product is worth adopting.*
*The prototype demonstrates how users experience its value.*

***A general entry point***

# Website Homepage

Introduces an organisation and helps visitors navigate different information, products, and services.

- Multiple audiences
- Different purposes
- Many navigation options

**Main question:**
Where do you want to go?

***A focused offer***

# Product Landing Page

Presents a specific product to a target audience, communicates its value, and encourages one primary action.

- Defined target audience
- Clear product promise
- Focused call to action (CTA)

**Main question:** Why should you care, and what should you do next?

*A landing page is not simply the first page of a website. It is designed to turn attention into a meaningful next action.*

# Anatomy of a Product Landing Page

Only the essential elements that communicate product's promise and guide visitors toward action.

## Headline

Communicates the central promise.

What does the product help people achieve?

## Support Message

Explains who the product serves, what problem it addresses, and how it creates value.

## Product visual

Shows what the product is or how it works, making the offer tangible.

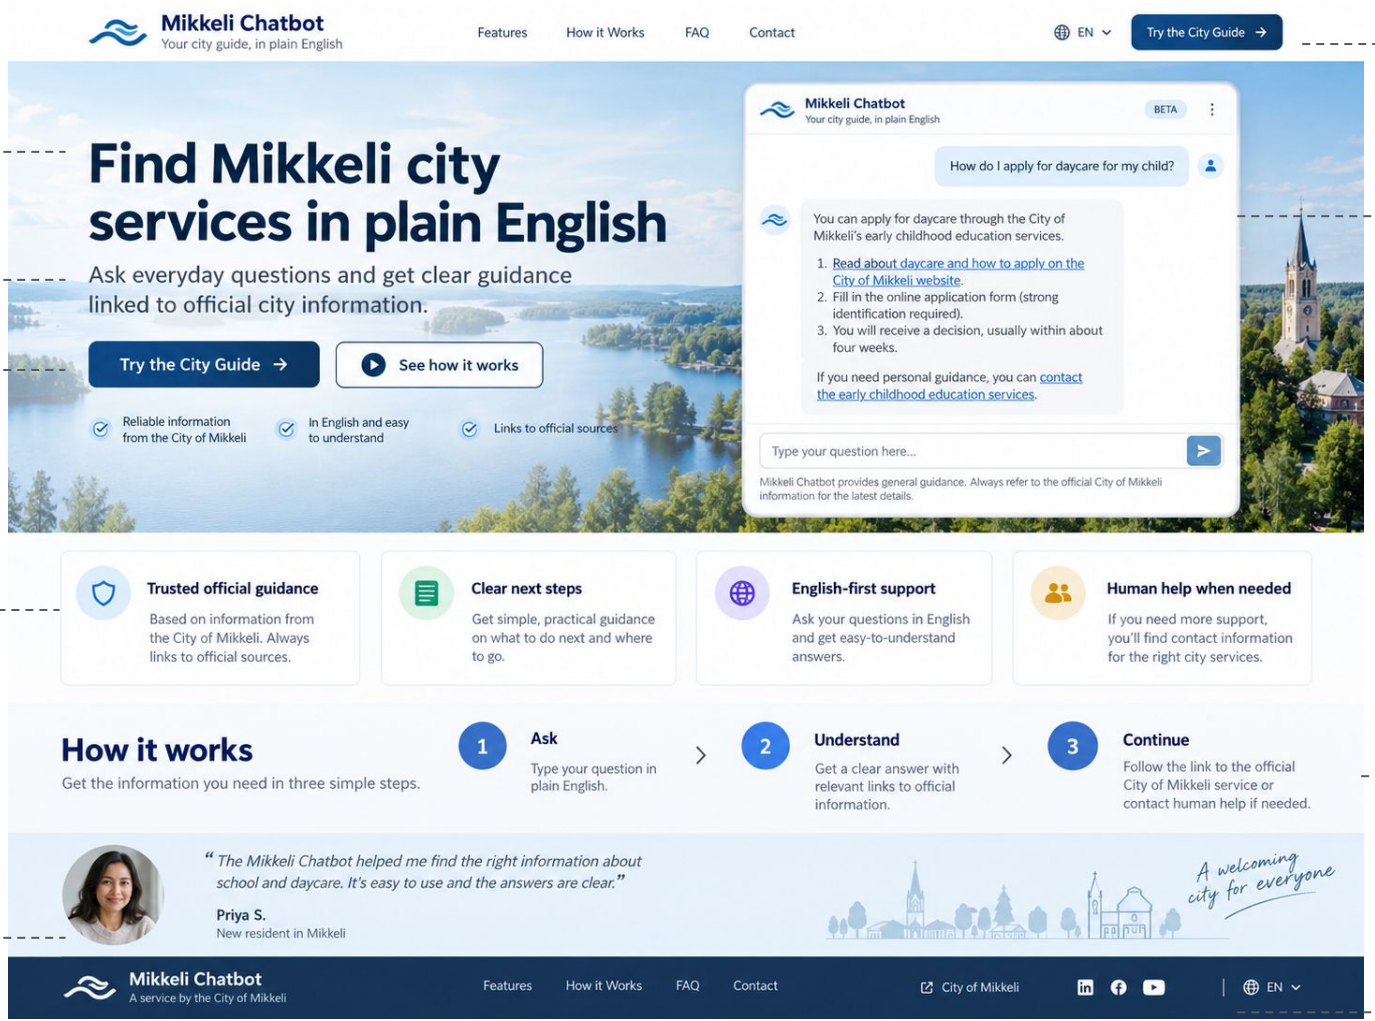

## Key benefits

Highlights the most important outcomes for the intended audience.

## Call to Action (CTA)

Invites visitors to take a next step, such as *Try the Demo* or *Join the Waitlist*.

- What is this?
- Why does it matter to me?
- What should I do next?

# What Is a Product Prototype?

A representation of a product that allows us to explore and experience how it would work.

## Proof of Concept prototype

Makes the proposed experience tangible

- Presents the main interface and key interactions.
- Allows users to perform basic tasks.
- Helps identify usability problems and opportunities for improvement.
- Can simulate functionality without implementing the entire system.

## Not a Finished Product

Does not need real coding / engineering

- Complete backend or database.
- Real integrations with external services.
- Production infrastructure and deployment.
- Every planned feature or user journey.

*A good prototype makes the critical user journey realistic enough to experience and test, without building the entire product.*

# Prototyping the Critical User Journey

Focus on the essential experience, not the entire product.

## User Goal

What does the user need to accomplish?

**Leila needs to understand how to apply for daycare in Mikkeli.**

## Key Interactions

What must the user be able to do?

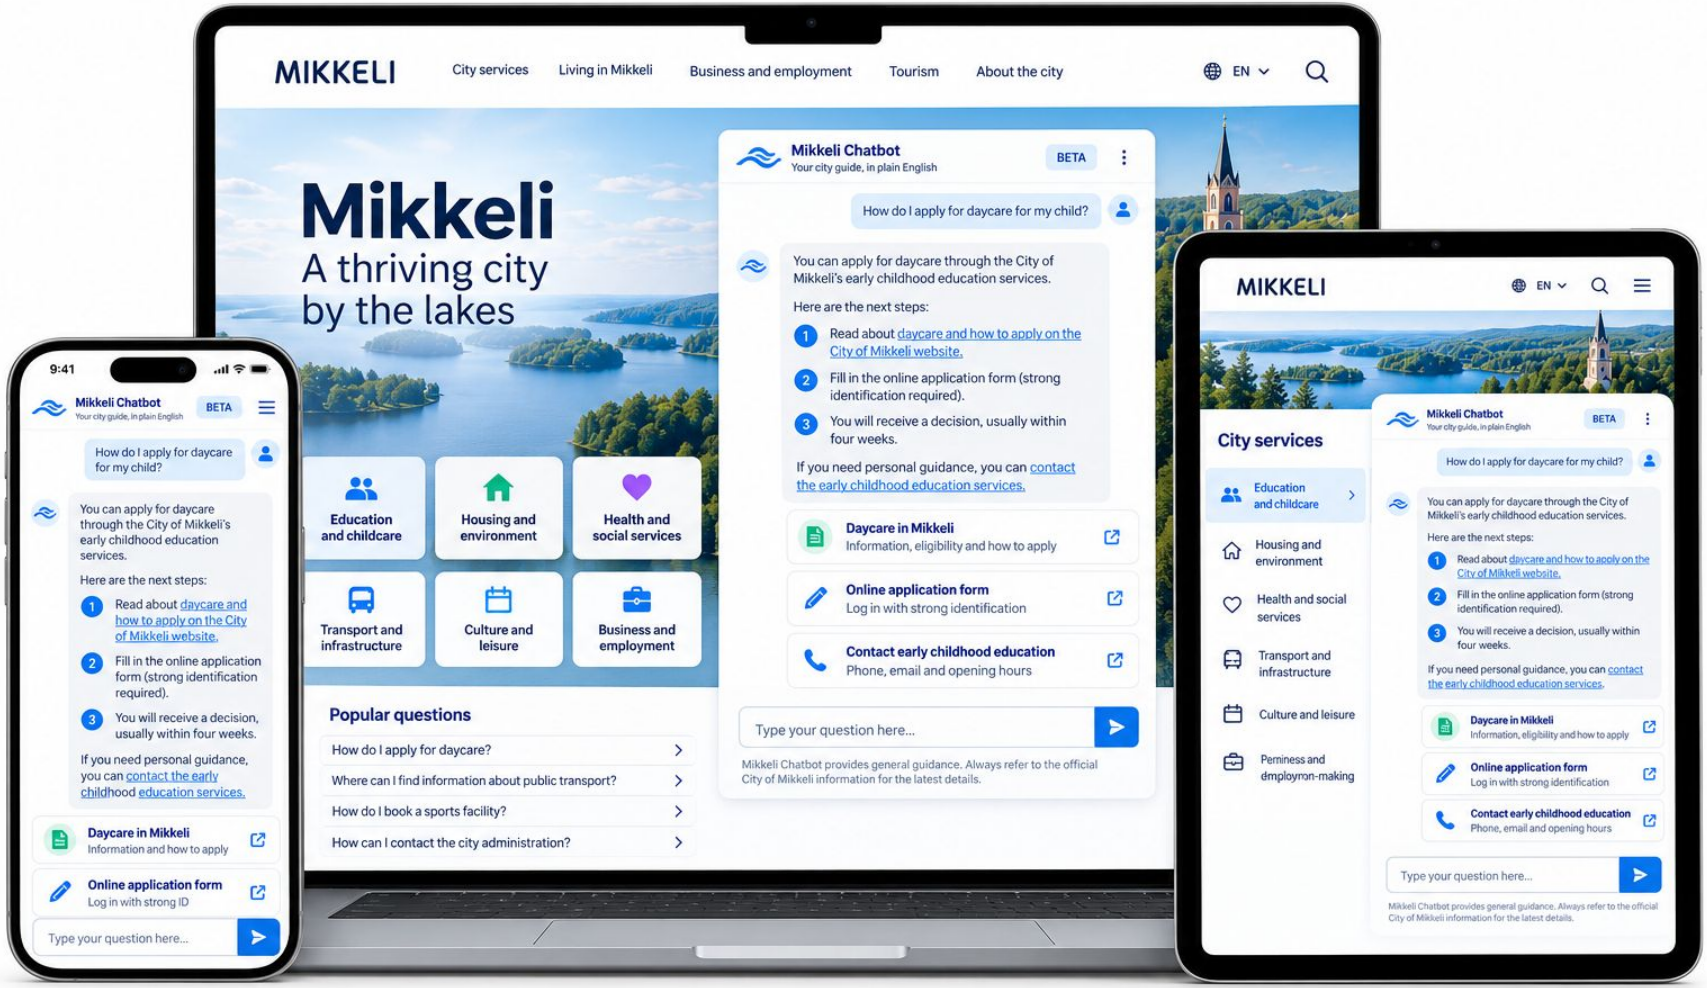

**Ask a question, receive guidance, and access official information.**

## Successful Outcome

How do we know the journey worked?

**Leila finds the correct next step and knows where to continue.**

A critical user journey is the essential sequence of interactions through which a user achieves a meaningful goal.

Popular questions
How do I apply for daycare?
Where can I find information about public transport?
How do I book a sports facility?
How can I contact the city administration?
Mikkeli Chatbot
Your city guide, in plain English
BETA
How do I apply for daycare for my child?
You can apply for daycare through the City of Mikkeli's early childhood education services.
Here are the next steps:
1 Read about daycare and how to apply on the City of Mikkeli website.
2 Fill in the online application form (strong identification required).
3 You will receive a decision, usually within four weeks.
If you need personal guidance, you can contact the early childhood education services.

# Defining the Prototype Scope

Focus on the essential experience, not the entire product.

## Must Work
(Essential interactions)

The user must complete the critical journey.

Mikkeli Chatbot:

- Enter a question.
- Receive Bot guidance.
- Follow a useful link.

## Can Be Simulated
(Underlying functionality)

The experience can be realistic without code.

Mikkeli Chatbot:

- Predefined answers.
- Example information.
- Mocked AI responses.

## Can Be Left Out
(Nonessential features)

What doesn't contribute to the journey demo.

Mikkeli Chatbot:

- User accounts.
- Member dashboard.
- Payments journeys

Prototype the experience, not the entire technical system.

# Before Our Next Lecture (4 November)

Come prepared with two products that others can access and try.

## Published Landing Page

Your product's public homepage

- A complete, professional-looking landing page.
- Communicates the product promise, benefits, and call to action.
- Published online, for example using GitHub Pages. Accessible through a working public URL.

## Shareable Functional Prototype

Your product's critical user experience

- A high-fidelity, interactive prototype.
- Demonstrates the selected critical user journey.
- Essential interactions work, even if some functionality is simulated.
- Accessible to others through a shareable link.

*Next lecture, we will prepare our prototypes for peer usability testing. Make sure others can open your links and interact with what you built.*

*Before asking AI to build anything, decide what your product must communicate and demonstrate.*

# Landing Page

Define the product promise

- Who is your target audience?
- What is your main message and value proposition?
- Which 3–4 benefits should stand out?
- What action should visitors take?

*What the audience needs to understand before considering your product?*

# Functional Prototype

Define the experience to simulate

- **User & goals:** Who is using it, and what do they need to accomplish?
- **Critical journey:** What sequence of actions will they perform?
- **Must work:** Which interactions need to function?
- **Can simulate/exclude:** Which processes can use predefined responses, mock data or left out?

*Think what people must be able to do without your team's guidance.*
