Prototyping the Critical User Journey

Focus on the essential experience, not the entire product.

User Goal

What does the user need to accomplish?

- **Resident:** Get mail & packages reliably and delegate mailbox access during specific timeframes
- **Janitor:** Intake oversized/overflow packages into secure storage, scan them, and notify residents directly

Key Interactions

What must the user be able to do?

- **Resident App:**
  - ↳ Live mailbox status & parcel arrival feed
  - ↳ Define timeframes & grant temporary smart mailbox access to third parties (e.g. neighbours)
- **Janitor Portal / Scanner:**
  - ↳ Overview of delivered parcels & storage capacity
  - ↳ Scan incoming parcels into extra storage & trigger automated push notification to resident

Successful Outcome

How do we know the journey worked?

- Janitor logs oversized parcels via barcode scan into extra storage and pushes immediate pickup alert
- Designated contact successfully opens smart mailbox within the authorized validity window
- Resident has full traceability of mail & parcel pickups during absences

A critical user journey is the essential sequence of interactions through which a user achieves a meaningful goal.
